

testing of genetically pdf

Genetically modified foods (GM foods), also known as genetically engineered foods (GE foods), or bioengineered foods are foods produced from organisms that have had changes introduced into their DNA using the methods of genetic engineering. Genetic engineering techniques allow for the introduction of new traits as well as greater control over traits when compared to previous methods, such as ...

Genetically modified food - Wikipedia

A genetically modified tree (GMt, GM tree, genetically engineered tree, GE tree or transgenic tree) is a tree whose DNA has been modified using genetic engineering techniques. In most cases the aim is to introduce a novel trait to the plant which does not occur naturally within the species. Examples include resistance to certain pests, diseases, environmental conditions, and herbicide ...

Not all of the genetically engineered varieties that have received regulatory approval are currently being grown. Some have not yet been marketed (herbicide tolerant sugarbeets and most kinds of GE tomatoes, for example), and some have been commercially grown but were later withdrawn from the market (see Discontinued Transgenic Products).

Farmers choose what seeds to grow based on what is best for their farms, market demand and local growing environments. In fact, there are a wide variety of seed options available to farmers, including organic, hybrid, conventional and genetically modified seeds. Many farmers successfully grow organic, non-GMO and genetically modified crops on the same farm.

Summary. Over 80% of genetically modified (GM) crops grown worldwide are engineered to tolerate being sprayed with glyphosate herbicides. GM glyphosate-tolerant crops have led to a 239 million kilogram (527 million pound) increase in herbicide use in the US between 1996 and 2011, compared with the amount that would have been used if the same acres had been planted to non-GM crops.
